

## **CLAY MICRO**

### **Why we are doing this study:**

We are trying to better understand why some people get “red eyes” or eye infections.

### **Who can be in the study:**

- Patients 18 to 33 years of age.
- We are looking for healthy soft contact lens wearers and those who have a doctor diagnosis of a corneal inflammatory event (white blood cells in the cornea).

### **What the study involves:**

There is only one visit that should take less than one hour. During the visit we will:

- Ask you questions about your general and eye health, and how you wear and care for your contact lenses
- Conduct an examination of the front surface of your eye
- Take cultures (swab) of your eyes, contact lens and contact lens case to study the bacteria present

### **Will you directly benefit from the study?**

Being in this study won't directly benefit you but it will help us learn more about contact lens complications so we can better educate and care for future patients.

### **Other things you should know about the study:**

You will receive \$50 for your time to be in the study.

**Principal Investigator:** Dr. Kathryn Richdale
